

UNICRON SYSTEMS

Three products. One closed-loop substrate.

The company is the product.

AI-native intelligence for sales teams, operators, and the founders running them.

ATRIUM

The operating system for an AI-native company.

METACRON

The control plane for your agent fleet.

PATHFINDER

Lead intelligence that calls procurement offices for you.

Leads that arrive before the RFP closes.

Public-data ingest, voice agents that call procurement offices without APIs, and a ranking engine that scores leads by adjacency to who you already serve. From source to sales rep in under an hour.

THE PAIN

Sales teams spend half their hours hunting public records, calling county clerks, and chasing RFPs that closed last week. Most leads come too late. Most outreach is generic. Adjacency to existing customer relationships, the strongest signal in the dataset, lives in someone's head.

THE SHIFT

Pathfinder runs nine specialist agents in parallel. They pull from sam.gov, USAspending, county records, and news. They rank by adjacency. They verify. They enrich with web research. They draft outreach already aware of the prospect's context. And they call procurement offices that have no public API, capture structured records from a real conversation, and write them as new leads.

WHAT IT DELIVERS

- Ranked leads with confidence scores and evidence trails
- Adjacency mapping: who in your network already knows this prospect
- Outreach drafts in the prospect's voice, not yours
- Voice-pulled procurement records from no-API offices (city clerks, flood districts, capital projects)
- Cross-pollination across customer relationships you've earned
- Pipeline visibility from first signal to closed contract

WHO IT'S FOR

Sales and BD teams in industries with public-data lead surfaces: construction security, government contracting, restoration, infrastructure services, regulated B2B. Anywhere a procurement office is the gatekeeper and a phone call still beats an inbox.

ZEDCOR DEPLOYMENT

24

branches served

Customer-zero is Zedcor (mobile solar surveillance towers, ~24 branches, construction security). Voice agent reaches Harris County Flood Control District on a monthly cadence to capture the \$410M+ in next-twelve-months bids the agency has open. From procurement office to BD rep's screen in under an hour, with structured records, contact info, and a draft outreach already waiting.

The control plane for your agent fleet.

Multi-tenant operator console where customer admins configure agents, review autonomous proposals, and see every action through a public refusal layer. Same primitives across every customer.

THE PAIN

Companies running AI agents at scale have no shared surface for monitoring, configuring, or refusing them. Every agent is a black box. Every config edit is an engineering ticket. Every agent action is unaudited until something goes wrong, at which point nobody can reconstruct what happened.

THE SHIFT

Metacron is the operator console where the agent fleet becomes legible. Customer admins edit configs without filing tickets. Architect proposals surface for review before they execute. The refusal register is public. Every action passes through it. Every override is logged forever.

WHAT IT DELIVERS

- Galaxy view of every agent with archetype, last run, cost, and budget remaining
- Architect proposals with weekly tuning and discovery loops
- Source onboarding and coverage expansion without code changes
- Public refusal log: every taboo bounce, every override, every decider
- Multi-tenant scoping with row-level isolation from day zero
- Per-tenant cost visibility and audit reports

WHO IT'S FOR

Companies whose agent fleet has grown beyond what one engineer can hand-hold. Customer admins managing per-tenant policy. Compliance teams who need legible audit trails. Founders who want to scale without scaling headcount.

PROOF

AGENT REGISTRY	DATA ISOLATION	SELF-SERVE EDITS
16	3	0
registered agents	schemas, multi-tenant	config tickets needed

Architect, Source Onboarder, Coverage Expansion, and the Tier 2 human-assist queue are running in production for Zedcor today. Voice configurations editable from the operator surface. The refusal layer is not a EULA bullet point; it is structural code that gates every system modification before it commits.

The operating system for an AI-native company.

Eight surfaces, one substrate. Where the founders, the agents, and the company itself become legible to each other. Built first for Unicron. Built next for the next generation of two and three person companies.

THE PAIN

AI-native companies have agents everywhere and no unified surface for the humans operating them. Slack overflows. Notion drifts. Decisions live in someone's head. Memory rots. Every new team member spends a week asking what the company is actually doing right now. The org chart fights the substrate that wants to coordinate it.

THE SHIFT

Atrium is the cockpit a small company can run on. Eight tabs covering Now, People, Work, Money, Marketing, Products, System, and Library. A refusal-gated substrate underneath. Every conversation, decision, and outcome captured into a queryable spine the company learns from. Closed-loop, not slot-machine.

WHAT IT DELIVERS

- One screen on the morning that tells you what needs you today
- A Slack-native Orchestrator that decomposes intent and dispatches agents
- Skills as clickable workflows: any team member runs a codified routine in one click
- Voice memos, calls, Slack threads, email all auto-captured into searchable memory
- Public taboo register; every system-modifying action validated before commit
- Continuity log: the Elder remembers prior commitments so the company keeps its word
- Decay on every artifact; institutional memory that stays fresh by default

WHO IT'S FOR

Two and three person companies who have decided to scale by tokens instead of headcount. Founders, advisors, contractors. Anyone who needs to operate as one organism without rebuilding

the bureaucracy AI was supposed to retire.

operator surfaces

ORCHESTRATOR · ANALYST ·
ELDER · TABOO KEEPER

4

always-on agents

TEAM

3

humans, peer-tier

Atrium runs on the same substrate that powers Pathfinder and Metacron. The Slack Orchestrator answers DMs in real time. The Analyst posts a digest at six every morning. The Elder consults on irreversible decisions. The Taboo Keeper refuses what should be refused. The humans focus on judgment; the agents handle the routing.

WHY THIS WORKS

Closed loops, not copilots bolted on.

The shift in AI is not productivity. It is capability. One person with the right stack can build what used to require an entire team. The companies that win are not the ones with the most tokens or the most headcount. They are the ones that organize around an intelligent layer instead of routing information through humans.

THE COMMON THREAD

All three products share one substrate. The same ledger captures every call, every decision, every Slack thread. The same refusal layer gates every agent action. The same vault stores every artifact under a Karpathy three-folder pattern (raw, wiki, outputs). The same agent fleet is queryable across every surface. What you see in Pathfinder is what Metacron renders for your operators is what Atrium watches for your founders.

THE COMMITMENTS

- **Closed loops everywhere.** Every action produces an artifact the system learns from.
- **Refusal as structural moat.** A public will-not-do register, not a EULA line item.
- **Decay by default.** Memory that stays fresh because stale signals archive themselves.
- **Multi-tenant from day zero.** Customer isolation at the schema, not the application.
- **Tokenmaxx, not headcountmaxx.** Lean teams running uncomfortable API bills, not bloated payroll.
- **Reciprocity in design.** Architectural hooks for contributor share, not philanthropy.

WHAT IT TAKES TO BUY IN

Pathfinder ships leads to your sales team this quarter. Metacron gives your operators a legible agent fleet by next quarter. Atrium becomes the cockpit your founders run on by end of year. They install in that order, but they share the same substrate, so buying any one of them positions you to compound the others.

We are running the architecture ourselves. Customer-zero is on it. The next conversation is whether you want to be customer-one.
